1848: John Stringfellow made a steam engine for a 10-foot wingspan model aircraft which achieved the first powered flight, albeit with negligible payload.  
1903: Charlie Taylor built an inline engine, mostly of aluminum, for the Wright Flyer (12 horsepower).  
1903: Manly-Balzer engine sets standards for later radial engines.

Aircraft engine operation and malfunction: Basic ... steam power in a practical way to power an aircraft was an impossible dream. Steam engines were heavy and required both fuel and water. However, inventors were not deterred, and experimental aircraft using steam engines to turn large fans for propulsion appeared as early as 1882. French engineer Clement Ader built a

The rotary engine was an early type of internal combustion engine, usually designed with an odd number of cylinders per row in a radial configuration, in which the crankshaft remained stationary in operation, with the entire crankcase and its attached cylinders rotating around it as a unit. Its main application was in aviation, although it also saw use

The Wright aircraft engine built in the early 1950s, prior to commercial turbine engines, and the Napier Nomad engine were designed as turbocompound engines. Interest in compound engines has returned, stimulated by Cummins' work on insulated turbocompound engines ( Kamo and Brysik, 1978 ), but these ideas need not necessarily be coupled together.

Aircraft Engines - an overview | ScienceDirect Topics

Thrust is the major force produced by airplane propulsion system i.e. aircraft engines. This force is used to propel aircraft in forward direction. When aircraft engines throw mass of air or exhaust in backward direction with some force, according to Newton's 3rd law a force with same magnitude propels aircraft in opposite direction.
