An engine is composed of several major components; the block, the crank, the rods, the pistons, the head (or heads), the valves, the cams, the intake and exhaust systems and the ignition system. These parts work together in an exacting manner to harness the chemical energy in gasoline, converting many small and rapid combustion events into a turning motion that eventually spins your wheels and propels your car.

The first thing you should know is a gasoline engine and a diesel engine are totally different. A gasoline engine is constructed much lighter than the heavier built diesel engine. The gasoline engine runs on a air and fuel mixture combined with a high energy spark that is timed to ignite inside each engine cylinder at the precise time creating power and torque turning force which drives your vehicle.

Diesel Engine Principles For Beginners

A beginner's set of tools can include screwdrivers, a few wrenches, pliers, and a good pair of channel locks. Add a jack, penetrating oil, and a little safety gear and you're good to go. What you don't have means a trip to the parts store, but eventually you'll have a garage full after enough repairs, so don't worry about that.

Learn the Basics of Auto Repair - LiveAbout

The engine of a modern day F1 car has 'power units' rather than just engines as in the olden days. This unit consists of six components. The Internal Combustion Engine (ICE), the Turbo Charger (TC), the Motor Generator Unit – H (MGU-H), Motor Generator Unit – Kinetic (MGU-K), the Energy Store (ES) and the Control Electronics (CE) taken together is called the Power Unit.
