Connecting Hollow Structural Section Members with Through-Bolts. By Jason McCormick. Associate Professor, Civil & Environmental Engineering, University of Michigan, Ann Arbor, MI, USA. Bolting steel members is often desirable because of ease of erection and the reliability of the joint. However, direct fastening to the wall of a hollow structural section (HSS) member poses a challenge due to difficulties in accessing the inside of the member resulting from its closed shape.

HOLLOW SECTIONS IN STRUCTURAL APPLICAT IONS by J. Wardenier PREFACE Professor Jaap Wardenier has had an enormous impact on the design methods for tubular steel structures in the late 20th. century. The Rectangular Hollow Section is veritably his progeny and it has grown up to be a respectable member of the steel society under his tutelage.

HOLLOW SECTIONS IN STRUCTURAL APPLICATIONS

Steel hollow sections also known as structural steel tube and hollow structural sections (HSS) is a type of steel that is formed into a hollow tubular section. Steel hollow sections are commonly used in welded frames, columns and as beams providing various benefits to a range of construction and mechanical applications.

A hollow structural section is a type of metal profile with a hollow cross section. The term is used predominantly in the United States, or other countries which follow US construction or engineering terminology. HSS members can be circular, square, or rectangular sections, although other shapes such as elliptical are also available. HSS is only composed of structural steel per code. HSS is sometimes mistakenly referenced as hollow structural steel. Rectangular and square HSS are also commonly c

There are two ways to make a slotted connection for a hollow structural section in tension. As shown in Figure 1.1, the most commonly employed method is to slot the tube longitudinally and insert a gusset plate into the slot. The gusset plate is then welded to the tube by longitudinal fillet welds.
