Electric power can be described as the rate per unit time in which electrical energy is transferred in an electric circuit. Electric power can simply be described as the product of the voltage and current. The SI unit power is watts. To give an intuitive perspective of how electric power can be intuitively felt, we can link it to mechanical power. In the below equation, P is electric power, while Q signifies the charge in coulombs. Furthermore, T is the time in seconds.

In electrical power systems a slack bus (or swing bus ), defined as a V bus, is used to balance the active power |P| and reactive power |Q| in a system while performing load flow studies. The slack bus is used to provide for system losses by emitting or absorbing active and/or reactive power to and from the system.
