The Black Death was the fourteenth century's equivalent of a nuclear war. It wiped out one-third of Europe's population, taking millions of lives. The author draws together the most recent scientific discoveries and historical research to pierce the mist and tell the story of the Black Death as a gripping, intimate narrative.

Looking beyond the view of the plague as unmitigated catastrophe, Herlihy finds evidence for its role in the advent of new population controls, the establishment of universities, the spread of Christianity, the dissemination of vernacular cultures, and even the rise of nationalism. This book, which displays a distinguished scholar's masterly synthesis of diverse materials, reveals that the Black Death can be considered the cornerstone of the transformation of Europe.

The book opens with an outline of the course of the pandemic, the causes and nature of bubonic plague, and the recent revisionist views of what the Black Death really was. The author presents the phenomenon of plague thematically by focusing on the places where people lived and worked: the home, the church and cemetery, the village, the pest houses, the streets and roads. The book then investigates contemporary theories of the causes of plague, doctors' futile attempts to treat victims, the authorities' vain attempts to prevent the pestilence, and its social impact. The narrative includes vivid examples from across Europe throughout the period, and presents the words of witnesses and victims

themselves wherever possible.--From publisher description.

A fascinating work of detective history, *The Black Death* traces the causes and far-reaching consequences of this infamous outbreak of plague that spread across the continent of Europe from 1347 to 1351. Drawing on sources as diverse as monastic manuscripts and dendrochronological studies (which measure growth rings in trees), historian Robert S. Gottfried demonstrates how a bacillus transmitted by rat fleas brought on an ecological reign of terror -- killing one European in three, wiping out entire villages and towns, and rocking the foundation of medieval society and civilization.

A spine-chilling saga of virulent racism, human folly, and the ultimate triumph of scientific progress. For Chinese immigrant Wong Chut King, surviving in San Francisco meant a life in the shadows. His passing on March 6, 1900, would have been unremarkable if a city health officer hadn't noticed a swollen black lymph node on his groin—a sign of bubonic plague. Empowered by racist pseudoscience, officials rushed to quarantine Chinatown while doctors examined Wong's tissue for telltale bacteria. If the devastating disease was not contained, San Francisco would become the American epicenter of an outbreak that had already claimed ten million lives worldwide. To local press, railroad barons, and elected officials, such a possibility was inconceivable—or inconvenient. As they mounted a cover-up to obscure the threat, ending the career of one of the most brilliant scientists in the nation in the process, it fell to federal

health officer Rupert Blue to save a city that refused to be rescued. Spearheading a relentless crusade for sanitation, Blue and his men patrolled the squalid streets of fast-growing San Francisco, examined gory black buboes, and dissected diseased rats that put the fate of the entire country at risk. In the tradition of Erik Larson and Steven Johnson, Randall spins a spellbinding account of Blue's race to understand the disease and contain its spread—the only hope of saving San Francisco, and the nation, from a gruesome fate.

Throughout the fourteenth century AD/eighth century H, waves of plague swept out of Central Asia and decimated populations from China to Iceland. So devastating was the Black Death across the Old World that some historians have compared its effects to those of a nuclear holocaust. As countries began to recover from the plague during the following century, sharp contrasts arose between the East, where societies slumped into long-term economic and social decline, and the West, where technological and social innovation set the stage for Europe's dominance into the twentieth century. Why were there such opposite outcomes from the same catastrophic event? In contrast to previous studies that have looked to differences between Islam and Christianity for the solution to the puzzle, this pioneering work proposes that a country's system of landholding primarily determined how successfully it recovered from the calamity of the Black Death. Stuart Borsch compares the specific cases of Egypt and England, countries whose economies were based in agriculture and whose pre-plague levels of total and agrarian gross

domestic product were roughly equivalent. Undertaking a thorough analysis of medieval economic data, he cogently explains why Egypt's centralized and urban landholding system was unable to adapt to massive depopulation, while England's localized and rural landholding system had fully recovered by the year 1500.

If the twenty-first century seems an unlikely stage for the return of a 14th-century killer, the authors of *Return of the Black Death* argue that the plague, which vanquished half of Europe, has only lain dormant, waiting to emerge again—perhaps, in another form. At the heart of their chilling scenario is their contention that the plague was spread by direct human contact (not from rat fleas) and was, in fact, a virus perhaps similar to AIDS and Ebola. Noting the periodic occurrence of plagues throughout history, the authors predict its inevitable re-emergence sometime in the future, transformed by mass mobility and bioterrorism into an even more devastating killer.
